

The Telementoring Experience

Immersive Educational Experiences

Our telementoring technologies allow the user to remotely connect and interact with the procedural team via real time, two-way, voice and video. Utilizing multiple video and audio feeds from within the procedural room to see and hear what is important.

Digital OR Cockpit

In addition to the multiple video streams, other intraoperative information is viewed to give the remote user an immersive view into the operating room.

Cutting Edge Technology

Augmented Reality (AR) and telestration allows the use of digital annotations overlaid on a live video feed of the operative field making the instruction more immersive and visual.

Personalized

Telementoring puts the remote user in the driving seat and allows them to focus on particular aspects of the procedure. They can control the view and zoom in on what they see as most relevant to their learning.
